Abstracting
similarities

Make a program readable

You never write a program only for a machine! You, others, tools will *read* the program for different purposes. Every minute spent in making a program more understandable pays off hours saved later.

- Type hinting makes clear what a function needs to work properly, and what it produces
- Documentation helps understanding without the need to read implementation details
- Examples of use make easy to remember how to use a function and can be used for verification

57

PyQB

Monga

Types,
docstrings,
doctests

Abstracting
similarities

Example

```

from typing import Union

Num = Union[int, float]

def cube(x: Num) -> Num:
    """Return the cube of x.

    >>> cube(-3)
    -27

    >>> abs(cube(0.2) - 0.008) < 10e-5
    True
    """
    return x * x * x

```

Examples can be tested by:
`python -m doctest filename.py.`

58

Procedural abstraction

PyQB

Monga

Types,
docstrings,
doctests

Abstracting
similarities

Procedural abstraction is key for our thinking process (remember the power of recursion, for example): giving a name to a procedure/function enhances our problem solving skills.

```
def sum_int(a: int, b: int) -> int:  
    """Sum integers from a through b.
```

```
>>> sum_int(1, 4)  
10
```

```
>>> sum_int(3, 3)  
3  
"""
```

```
assert b >= a  
result = 0  
for i in range(a, b+1):  
    result = result + i  
return result
```

59

Another "sum"

PyQB

Monga

Types,
docstrings,
doctests

Abstracting
similarities

This is very similar...

```
def sum_cubes(a: int, b: int) -> int:  
    """Sum the cubes of the integers from a through b.
```

```
>>> sum_cubes(1, 3)  
36
```

```
>>> sum_cubes(-2, 2)  
0
```

```
"""  
assert b >= a  
result = 0  
for i in range(a, b+1):  
    result = result + int(cube(i))  
return result
```

60

Another "sum"

PyQB

Monga

Types,
docstrings,
doctests

Abstracting
similarities

This is also very similar...

$\frac{1}{a \cdot (a+2)} + \frac{1}{(a+4) \cdot (a+6)} + \frac{1}{(a+8) \cdot (a+10)} + \dots + \frac{1}{(b-2) \cdot (b)}$
(Leibniz: $\frac{1}{1 \cdot 3} + \frac{1}{5 \cdot 7} + \frac{1}{9 \cdot 11} + \dots = \frac{\pi}{8}$)

```
def pi_sum(a: int, b: int) -> float:  
    """Sum  $\frac{1}{a(a+2)}$  terms until  $(a+2) > b$ .
```

```
>>> from math import pi  
>>> abs(8*pi_sum(1, 1001) - pi) < 10e-3  
True
```

```
"""  
assert b >= a  
result = 0.0  
for i in range(a, b+1, 4):  
    result = result + (1 / (i * (i + 2)))  
return result
```

61

Can we abstract the similarity?

PyQB

Monga

Types,
docstrings,
doctests

Abstracting
similarities

```
from typing import Callable
```

```
def gen_sum(a: int, b: int, fun: Callable[[int], Num], step: int = 1) -> Num:  
    """Sum terms from a through b, incrementing by step.
```

```
>>> gen_sum(1, 4, lambda x: x)  
10
```

```
>>> gen_sum(1, 3, cube)  
36
```

```
>>> from math import pi  
>>> abs(8*gen_sum(1, 1000, lambda x: 1 / (x * (x + 2))), 4) - pi) < 10e-3  
True
```

```
"""  
assert b >= a  
result = 0.0  
for i in range(a, b+1, step):  
    result = result + fun(i)  
if result.is_integer():  
    return int(result)  
return result
```
