Lecture IV: Functions

23

Summary

In Python3

- Variables are names to refer to objects;
- Objects are elements of types, which define the operations that make sense on them;
- Therefore, the basic instructions are the assignment (bind a name to an object), the proper operations for each object, and the commands to ask the services of the operating system;
- One can alter the otherwise strictly sequential execution of instruction with control flow statements: `if`, `for`, `while`.

Remember that in python3, indentation matters (it is part of the syntax).

24

Homework

- Solve "One Triangle" on CS Circles
- Submit your solution via github
  https://classroom.github.com/a/Itfv06Jy
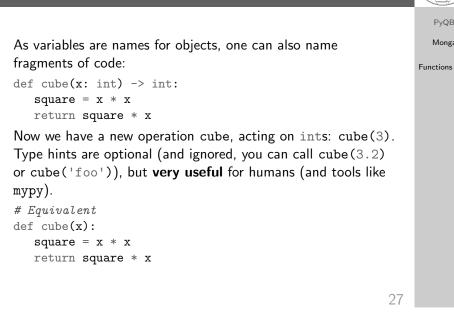

25

Proper operations

- On objects one can apply binary and unary operators: `2 * 3 -(-5.0) not True 'foo' + 'bar'`...
- There also built-in functions like `max(8,5,6)`, the full list is here: `https://docs.python.org/3/library/functions.html`
- (syntactically, commands like `print` or `input` cannot be distinguished from other built-in functions)
- Every object has `methods` that can be applied with the so called **dot notation**: `(3.2).is_integer()` `'foo'.upper()` `'xxx'.startswith('z')`; the list of which methods an object has is given by `dir(object)`.

26

Definition of functions

As variables are names for objects, one can also name fragments of code:

```
def cube(x: int) -> int:
    square = x * x
    return square * x
```

Now we have a new operation cube, acting on `int`s: `cube(3)`. Type hints are optional (and ignored, you can call `cube(3.2)` or `cube('foo')`), but **very useful** for humans (and tools like mypy).

```
# Equivalent
def cube(x):
    square = x * x
    return square * x
```

27

## A function computes a result

- Returns a useful result
```
def concat_with_a_space(string1, string2):
    return string1 + ' ' + string2

# string1 is the _formal_ parameter
# 'foo' is the _actual_ parameter (like an assigment string1 =
↪    'foo')
print(concat_with_a_space('foo','bar'))
```
- Return `None`
```
def repeated_print(string, repetitions):
    for i in range(0, repetitions):
        print(string)

repeatedPrint('Hello, world!', 3)
```
- **Recursive call**:
```
def repeatedPrint(string, repetitions):
    if repetitions > 0:
        print(string)
        repeatedPrint(string, repetitions - 1)

repeatedPrint('Hello, world!', 3)
```

28

Functions are objects too

One can assign functions to variables:

```
def cube(x: int) -> int:
    square = x * x
    return square * x

mycube = cube

print(mycube(3))
print(type(mycube))
```

And short functions can even be expressed as literal expressions (lambda expressions)

```
cube = lambda y: y*y*y
```

29

Naming helps solving

The tower of Hanoi

`https://www.mathsisfun.com/games/towerofhanoi.html`

Describe the moves for a solution

Recursive thinking is a powerful problem solving technique and it can be translated to Python thanks to recursive calls.
Hanoi moves $A \rightarrow C$:

- In A there is just one disk: move it to C
- Otherwise in A there are n disks (> 1):
  - **leap of faith!** I suppose to know the moves needed to move $n - 1$ disk; then
    - apply this (supposed) solution to move $n - 1$ disks from A to B (leveraging on C, empty, as the third pole)
    - move the last disk from A to C
    - apply the (supposed) solution to move $n - 1$ disks from B to C (leveraging on A, now empty, as the third pole)

This implicit description solve the problem! Finding a non-recursive solution is possible but not that easy.

In Python

```python
def hanoi(n: int, a_from: str, c_to: str,
          b_intermediate: str):
  if n == 1:
    print('Move 1 disk from ' + a_from + ' to ' + c_to)
    return
  hanoi(n - 1, a_from, b_intermediate, c_to)
  print('Move 1 disk from ' + a_from + ' to ' + c_to)
  hanoi(n - 1, b_intermediate, c_to, a_from)

hanoi(3, 'A', 'C', 'B')
```

Homework

- Chapters 7A, 10, 11A, 11B, 11C, 12
- Create an account on `https://github.com/` (if you don't have one) and send me the name (Zulip preferred, use a private message if you don't want to make it known to the other students).
