## Lecture IV: Functions

## Summary

In Python3

- Variables are names to refer to objects;
- Objects are elements of types, which define the operations that make sense on them;
- Therefore, the basic instructions are the assignment (bind a name to an object), the proper operations for each object, and the commands to ask the services of the operating system;
- One can alter the otherwise strictly sequential execution of instruction with control flow statements: if, for, while.
Remember that in python3, indentation matters (it is part of the syntax).

## Homework

Monga

- Solve "One Triangle" on CS Circles
- Submit your solution via github https://classroom.github.com/a/Itfv06Jy

## Proper operations

- On objects one can apply binary and unary operators: 2 * 3 -(-5.0) not True 'foo' + 'bar'...
- There also built-in functions like max $(8,5,6)$, the full list is here: https:
//docs.python.org/3/library/functions.html
- (syntactically, commands like print or input cannot be distinguished from other built-in functions)
- Every object has methods that can be applied with the so called dot notation: (3.2).is_integer() 'foo'. upper() 'xxx'.startswith('z'); the list of which methods an object has is given by dir (object).

## Definition of functions

As variables are names for objects, one can also name fragments of code:

```
def cube(x: int) -> int:
    square = x * x
    return square * x
```

Now we have a new operation cube, acting on ints: cube (3). Type hints are optional (and ignored, you can call cube (3.2) or cube ('foo')), but very useful for humans (and tools like mypy).
\# Equivalent
def cube(x):
square $=\mathrm{x} * \mathrm{x}$
return square * x

## A function computes a result

- Returns a useful result

```
def concat_with_a_space(string1, string2):
    return string1 + ' ' + string2
# string1 is the _formal_ parameter
# 'foo' is the _actual_ parameter (like an assigment string1 =
@ 'foo')
print(concat_with_a_space('foo','bar'))
```

- Return None

```
```

def repeated_print(string, repetitions):

```
```

def repeated_print(string, repetitions):
for i in range(0, repetitions):
for i in range(0, repetitions):
print(string)

```
```

        print(string)
    ```
```

repeatedPrint('Hello, world!', 3)

- Recursive call:

```
```

def repeatedPrint(string, repetitions):

```
```

def repeatedPrint(string, repetitions):
if repetitions > 0:
if repetitions > 0:
print(string)
print(string)
repeatedPrint(string, repetitions - 1)

```
```

        repeatedPrint(string, repetitions - 1)
    ```
```

repeatedPrint('Hello, world!', 3)

## Functions are objects too

```
One can assign functions to variables:
mycube = cube
print(mycube(3))
print(type(mycube))
And short functions can even be expressed as literal expressions (lambda expressions)
cube = lambda y: y*y*y
```

```
def cube(x: int) -> int:
```

def cube(x: int) -> int:
square = x * x
square = x * x
return square * x

```
    return square * x
```

## Naming helps solving

The tower of Hanoi
https://www.mathsisfun.com/games/towerofhanoi.html

## Describe the moves for a solution

Recursive thinking is a powerful problem solving technique and it can be translated to Python thanks to recursive calls. Hanoi moves $A \rightarrow C$ :

- In $A$ there is just one disk: move it to $C$
- Otherwise in $A$ there are $n$ disks $(>1)$ :
- leap of faith! I suppose to know the moves needed to move $n-1$ disk; then
- apply this (supposed) solution to move $n-1$ disks from $A$ to $B$ (leveraging on $C$, empty, as the third pole)
- move the last disk from $A$ to $C$
- apply the (supposed) solution to move $n-1$ disks from $B$ to $C$ (leveraging on $A$, now empty, as the third pole)
This implicit description solve the problem! Finding a non-recursive solution is possible but not that easy.

## In Python

def hanoi(n: int, a_from: str, c_to: str,
$\hookrightarrow$ b_intermediate: str):
if $\mathrm{n}==1$ :
print('Move 1 disk from ' + a_from + ' to ' + c_to) return
hanoi(n - 1, a_from, b_intermediate, c_to) print('Move 1 disk from ' + a_from + ' to ' + c_to) hanoi(n - 1, b_intermediate, c_to, a_from)
hanoi(3, 'A', 'C', 'B')

## Homework

Monga

- Chapters 7A, 10, 11A, 11B, 11C, 12
- Create an account on https://github.com/ (if you don't have one) and send me the name (Zulip preferred, use a private message if you don't want to make it known to the other students).
