Lecture VIII: Other Composite Objects

A `set` is a composite object with no duplicate (non mutable) elements. Common set operations are possible.

- Set literals: `{1,2,3}` `set()`
- `{1,2,3}.union({3,5,6})`
`{1,2,3}.intersection({3,5,6})`

Comprehensions

Comprehensions are a concise way to create lists, sets, maps... It resembles the mathematical notation used for sets

$$A = \{a^2 | a \in \mathbb{N}\}.$$

```
squares = [x**2 for x in range(10)]
```

equivalent to:

```
squares = []  
for x in range(10):  
    squares.append(x**2)
```

filtering is possible

```
odds = [x for x in range(100) if x % 2 != 0]
```

with a set

```
s = {x for x in range(50+1) if x % 5 == 0}
```

with a dict

```
d = {x: x**2 for x in range(10)}
```

Make a program readable

You never write a program only for a machine! You, others, tools will *read* the program for different purposes. Every minute spent in making a program more understandable pays off hours saved later.

- **Type hinting** makes clear what a function needs to work properly, and what it produces
- **Documentation** helps understanding without the need to read implementation details
- **Examples of use** make easy to remember how to use a function and can be used for verification

Example

```
from typing import Union

Num = Union[int, float]

def cube(x: Num) -> Num:
    """Return the cube of x.

    >>> cube(-3)
    -27

    >>> abs(cube(0.2) - 0.008) < 10e-5
    True
    """
    return x * x * x
```

Examples can be tested by:

```
python -m doctest filename.py.
```
