Lecture XIV: NumPy arrays

NumPy is a third-party library very popular for scientific/numerical programming (<https://numpy.org/>).

- Features familiar to matlab, R, Julia programmers
- The key data structure is the **array**
 - 1-dimension arrays: **vectors**
 - 2-dimension arrays: **matrices**
 - n-dimension arrays

In some languages array is more or less synonym of list: Python distinguishes: **lists** (mutable, arbitrary elements), **arrays** (mutable, all elements have the same type), **tuples** (immutable, fixed length, arbitrary elements).

NumPy arrays

The most important data structure in NumPy is `ndarray`: a (usually fixed-size) sequence of same type elements, organized in one or more dimensions.

<https://numpy.org/doc/stable/reference/arrays.ndarray.html>

Implementation is based on byte arrays: accessing an element (all of the same byte-size) is virtually just the computation of an 'address'.

NumPy

ndarray

Creation

- using NumPy arrays is often more compact, especially when there's more than one dimension
- faster than lists when the operation can be **vectorized**
- (slower than lists when you append elements to the end)
- can be used with element of different types but this is less efficient

A ndarray has a dtype (the type of elements) and a shape (the length of the array on each dimensional axis). (Note the jargon: slightly different from linear algebra)

- Since appending is costly, normally they are pre-allocated (zeros, ones, arange, linspace, ...)
- vectorized operations can simplify code (no need for loops) and they are faster with big arrays
- vector indexing syntax (similar to R): very convenient (but you need to learn something new)

All the elements must have the same size

This is actually a big limitation: the faster access comes with a price in flexibility.

```
>>> np.array(['', '', ''])
array(['', '', ''], dtype='<U1')
>>> np.array(['a', 'bb', 'ccc'])
array(['a', 'bb', 'ccc'], dtype='<U3')
>>> np.array(['a', 'bb', 'cccccccccccccccccccccccc'])
array(['a', 'bb', 'cccccccccccccccccccccccc'], dtype='<U21')
```
